## ***Brief Intro to Cloud DBMS. What and Why?***

For the upcoming assignments, we will be using an Azure SQL DBMS hosted in the cloud.

Storage of the database schema and data and management of hardware and software needed to run the DBMS will all be managed by the cloud provider (Microsoft). We will configure our database through the web interface and connect to it through the client applications on your laptop/desktop (web browser, Azure Data Studio IDE, your Java application, etc.)

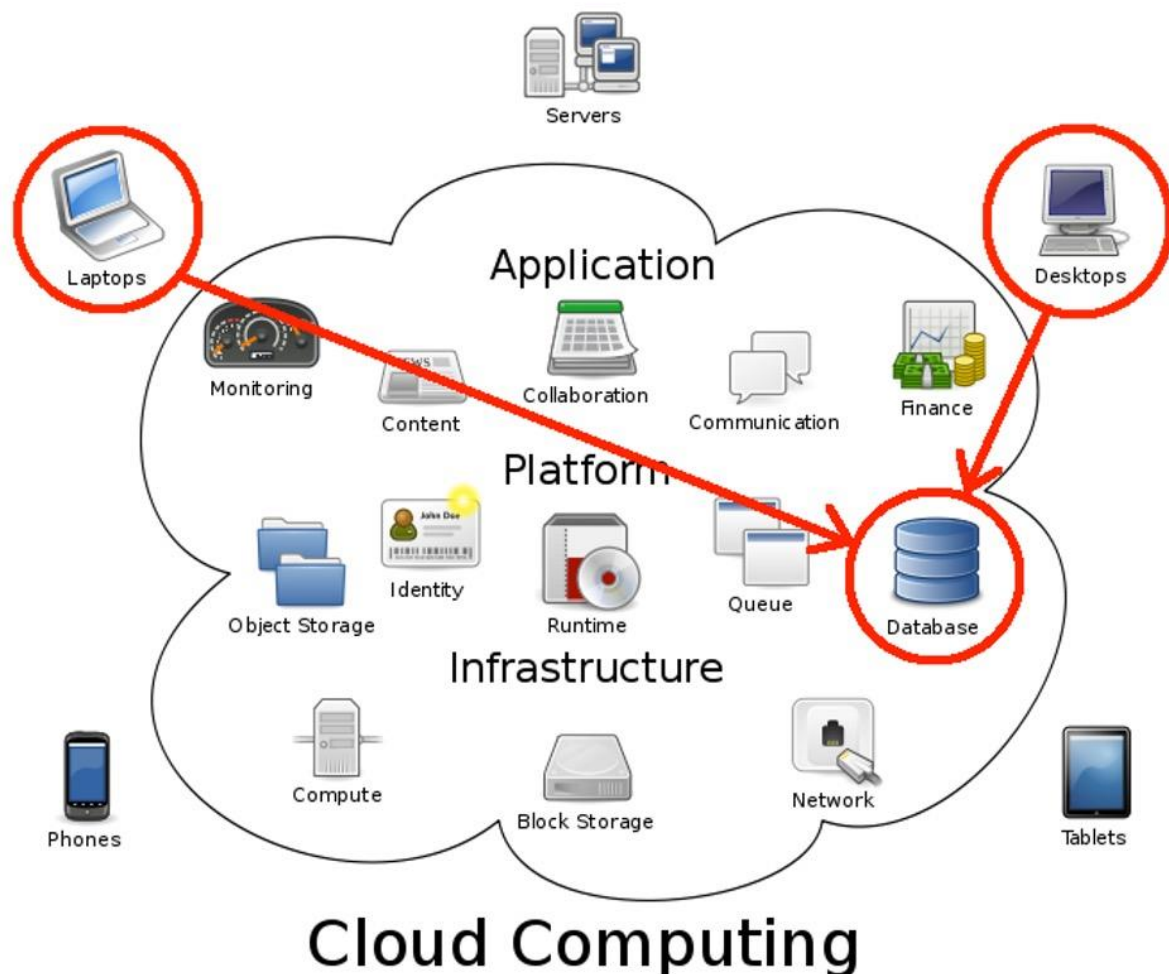

Image source: <https://www.fastmetrics.com/blog/tech/what-is-cloud-computing/>

Using the cloud for the database hosting is a case of purchasing a Platform-as-a-Service (PaaS) from the cloud provider. Doing so allows us to only care about designing the database, queries, and configuring/developing the applications we use to connect and issue queries to the database (see below image). We no longer need to install the software and provision the hardware to run the DBMS. We also don't need to keep our own desktop/laptop/server running to keep the DBMS alive, as well as we don't require setting up a web server or a domain name so that our database is accessible from the internet. So, as you can tell, this setup offers quite a few advantages.

## Creating a Free Microsoft Azure Student Subscription

### Steps to Follow

1. Open new **Incognito** (this is important) window in your web browser.
2. Go to - <https://azure.microsoft.com/en-us/free/students/>
3. Click on “Activate Now” button

4. Above might lead you to <https://login.microsoftonline.com> first where you will be asked to log into your OU account

UNIVERSITY of OKLAHOMA

← [Redacted]

**Enter password**

[Redacted]

[Forgot my password](#)

[Sign in](#)

Password problems? Visit <https://account.ou.edu>

5. You should get redirected to <https://signup.azure.com> very you will be asked to provide and verify your phone number.

**Identity Verification by phone** ^

A text or phone call helps us make sure this is you.

Country code  
United States (+1) v

Phone number  
[Redacted]

Text me Call me

6. Next, fill the forms, read, and accept subscription agreement, offer details, privacy statement, and communications policy. Click “Sign Up” button.

**Your profile** ^

Country/Region ⓘ  
United States v

Choose the location that matches your billing address. **You cannot change this selection later.** If your country is not listed, the offer is not available in your region. [Learn More](#)

First name [Redacted]

Last name [Redacted]

Email address for important notifications ⓘ  
[Redacted]

Phone  
[Redacted]

By proceeding you acknowledge that if you use your organization's email, your organization may have rights to access and manage your data and account. [Learn more](#)

☒ I agree to the [subscription agreement](#), [offer details](#), and [privacy statement](#).

I will receive information, tips, and offers about Azure, including Azure Newsletter, Pricing updates, and other Microsoft products and services.

☐ I would like Microsoft to share my information with select partners so I can receive relevant information about their products and services.

Sign up

7. If prompted for feedback, please submit it (see screenshot below).

Your account is all setup. Please finish feedback to continue.

Are you satisfied with your signup experience?

☒  ☐ 

Anything else you'd like to let us know?

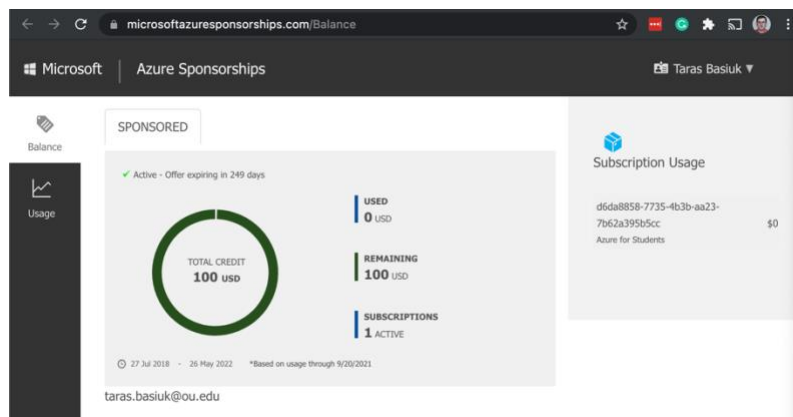

Please do not share any personally identifying information such as name, phone number, address, e-mail address or credit card number

Providing your feedback is optional. If you choose to do so, it will be used for product improvement purposes.

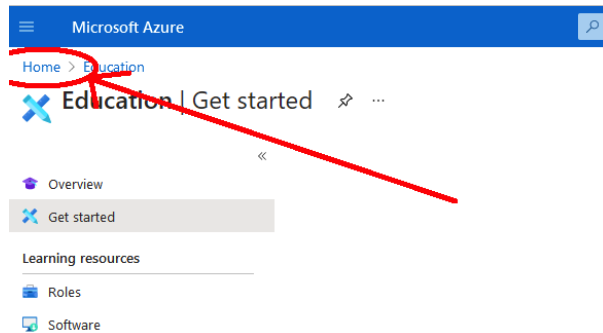

By clicking Submit, you authorize Microsoft to optionally contact you via e-mail if we have any additional questions regarding your feedback.

8. Doing all above will add \$100 of free credit to your student account to be used within a year. You can check your remaining balance (see the screenshot below) at

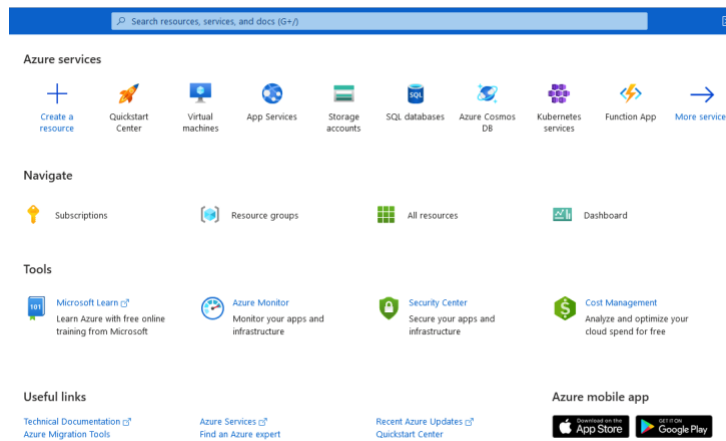

<https://www.microsoftazuresponsorships.com/Balance>

9. When logging in <https://portal.azure.com> for the first time you might see "Education" tab opened for you. We won't be using it, so go to "Home"

10. Once you get redirected to <https://portal.azure.com/#home> and see the below perspective on your screen, you're ready to proceed to create your own SQL server

## Possible Complications

We estimate that the free credit provided by the Microsoft for your account would be sufficient for your work in this course **if you carefully follow the instructions below**. However, If you find yourself ineligible for the offer, short of free credit or your student account was (will be) deactivated due to the offer expiring after a year, you need to upgrade it to a pay-as-you-go account (see the link below), in which case your expenditures will sum up to \$5/month if you carefully follow our instructions.

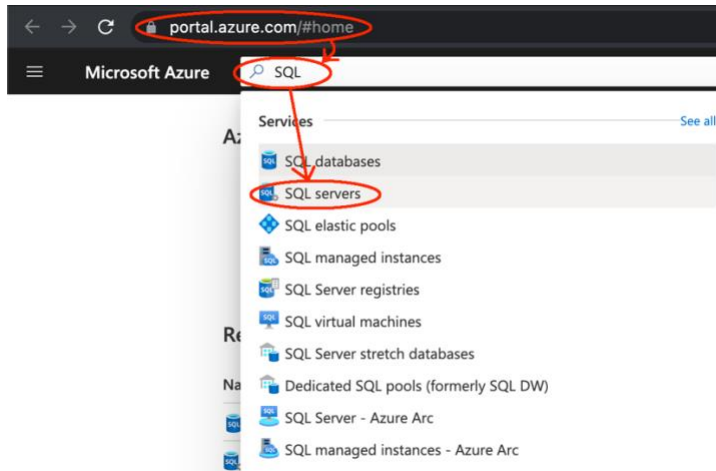

<https://docs.microsoft.com/en-us/azure/billing/billing-upgrade-azure-subscription>

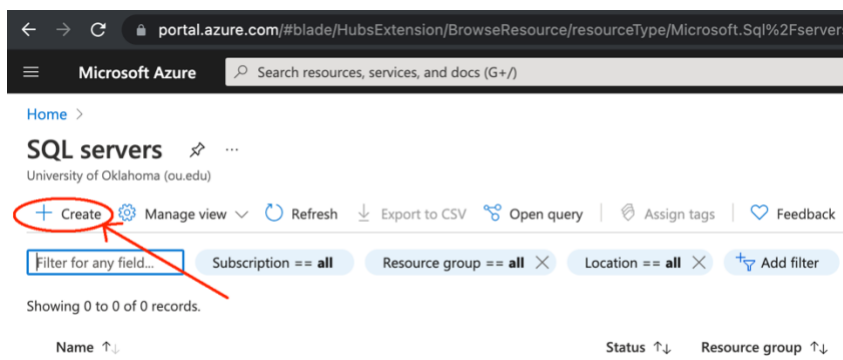

## Creating your Personal SQL Server

### Steps to Follow

1. Navigate to <https://portal.azure.com/#home> Enter SQL into the search bar, select “SQL Server” from the presented options

2. You should be redirected to the webpage seen on the screenshot below. Click on “+ Add” button.

3. You should be redirected to the web-page seen on the screenshot below with the fields being empty (or having default values).
4. Type in the values into the empty fields of the right panel, make appropriate option selections (as seen on the below screenshot), create and select a new resource group

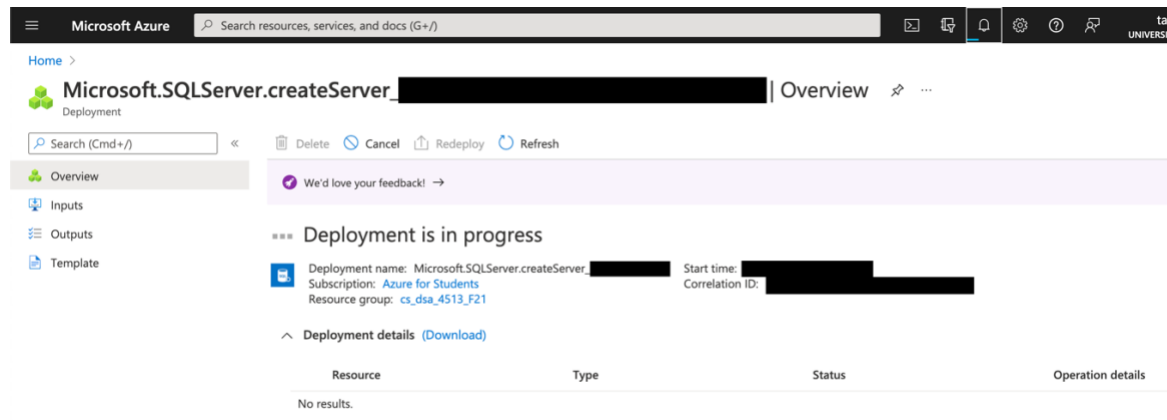

*cs\_dsa\_4513\_F21* by clicking on “create new” link, pick your own password. Instead of our <your4x4> placeholder, use your actual 4x4 (a.k.a OUNetID), which you can look-up at <https://accounts.ou.edu/>

- a. **!!!WARNING!!!** Some students reported problems creating database servers in “(US) East US” location. If you’re experiencing it, try picking a different location geographically adjacent to you. If nothing works, try again later. If nothing is available after a day, please contact us. **!!!WARNING!!!**
5. Finally, click on the “Review + create” button.

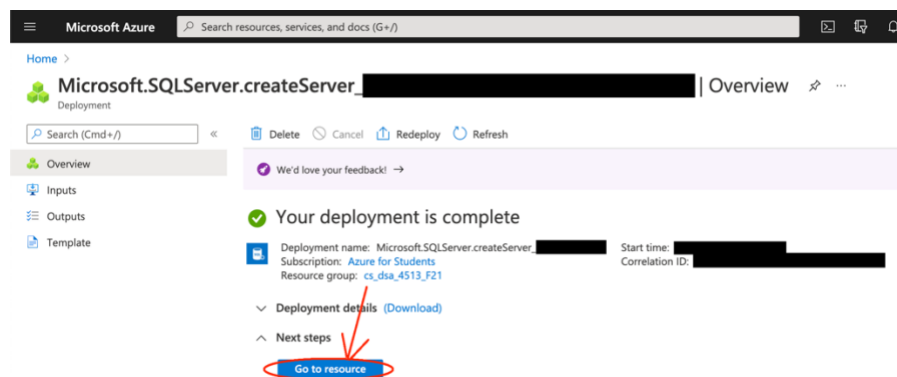

The screenshot shows the 'Create SQL Database Server' page in the Azure portal. The page is titled 'Create SQL Database Server' and is part of the 'Microsoft Azure' portal. The left sidebar shows 'SQL servers' under 'University of Oklahoma (ou.edu)'. The main content area is divided into sections: 'Project details', 'Server details', and 'Administrator account'. Red circles and arrows highlight the following fields: 'Resource group' (set to 'cs\_dsa\_4513\_F21'), 'Server name' (set to 'your4x4-sql-server'), 'Location' (set to '(US) East US'), 'Server admin login' (set to 'your4x4'), 'Password', and 'Confirm password'. The 'Review + create' button is highlighted at the bottom left. A 'Next: Networking >' button is visible at the bottom right.

- Clicking the “Create” button on the next screen will start the deployment of your SQL server.

You should be redirected to the deployment progress reporting window.

- Wait for your deployment to finish. If everything is well, then click on “Go to resource” and proceed to the next section of this instruction document.

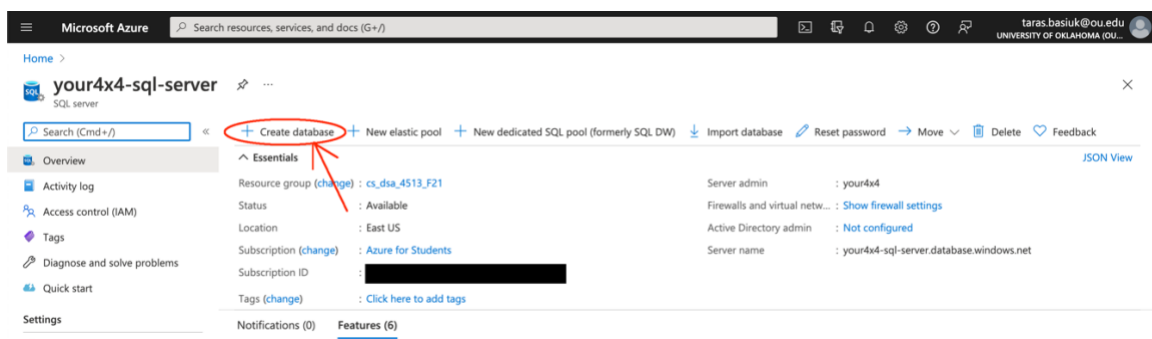

## Possible Complications

If you made a mistake while creating your SQL server (wrong input for example), short of resetting the password, adjustments cannot be made. Instead, you should delete the server and create a new one. Follow the below instruction regarding the navigation to your newly created SQL server. But instead of following other instructions, click on “Delete” button, confirm the deletion by typing in the server name (“<your4x4>-sql-server”) into the form and click another “Delete” button at the bottom. Now repeat the instructions at the beginning of Part 2, but now hopefully correcting for your mistake.

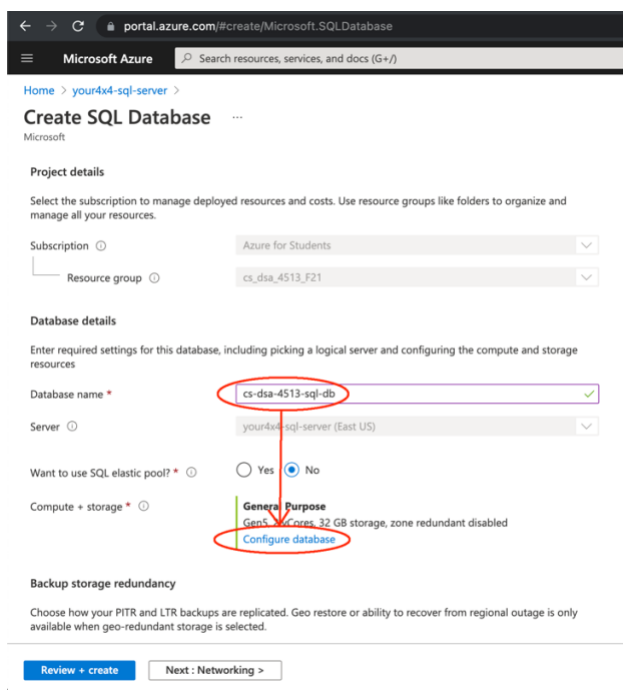

## Create Your Own SQL Database

### Steps to Follow

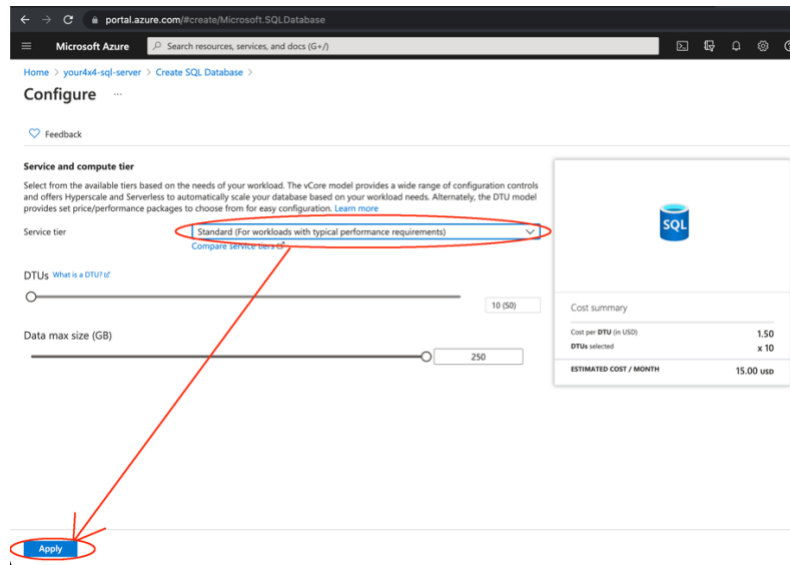

1. If you clicked on the “Go to resource” button mentioned in the previous section, you should see the webpage from the screenshot below. Alternatively, you can search for `<your4x4>-sql-server` in the search field. Alternatively, your new server should now show up on “SQL Servers” webpage from page 8.

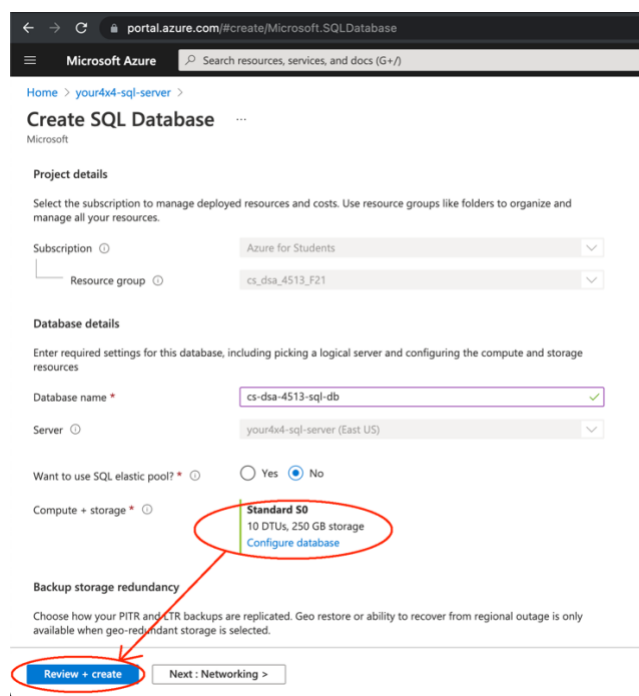

2. Click on “+ Create database” button. You should now see the panel below. **Please pay some extra attention next.**

3. Type “cs-dsa-4513-sql-db” into “Database name” field.
4. Click on “Configure database” link.
5. Once on the “Configure” page, select “Standard” under the Service Tier, then click “Apply”.

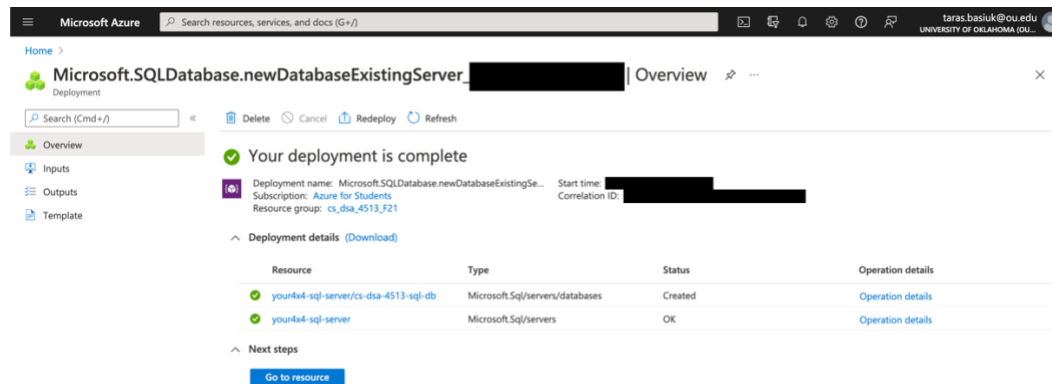

6. Now your “SQL database” panel should look like below. Verify that “Compute + storage” no longer lists “Gen5, 2 vCores, 32 GB” configuration. Only then click on “Review + create” button. If you don’t do the verification, your free credits will evaporate very quickly.

7. Clicking “Create” button on the next screen will start the deployment of your SQL database.

Wait until it finishes. We will try to connect to your database in the next section.

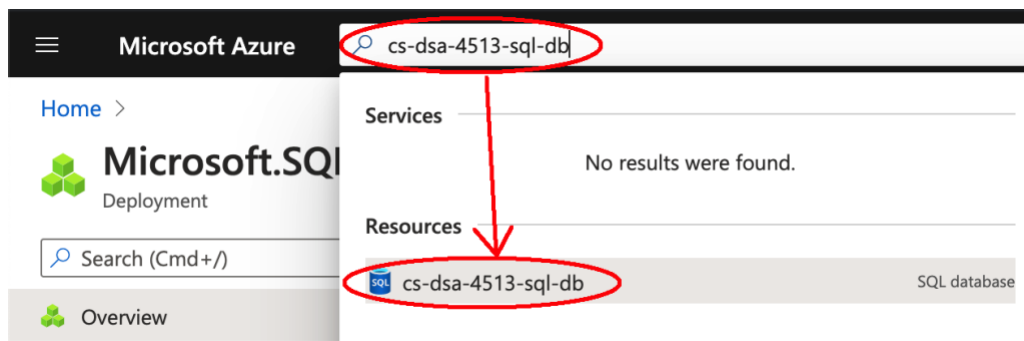

## Possible Complications

If you’ve made a mistake while creating your SQL database, see the below instructions on how to navigate to it, delete it using the corresponding icon, and recreate it correcting for your mistake.

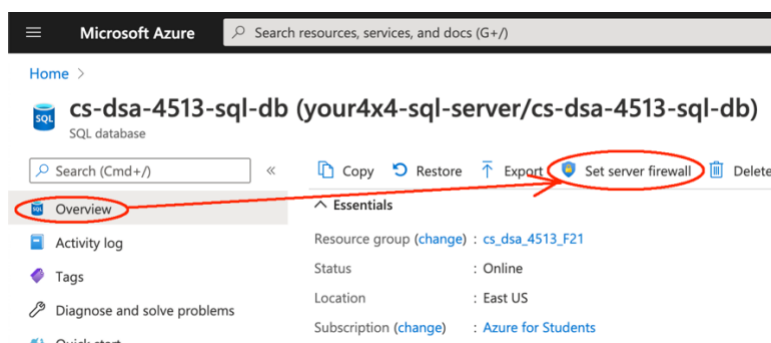

## Connecting to Your SQL Database from Azure Portal

### Firewall Configuration Steps

1. Enter “cs-dsa-4513-sql-db” into the search field and select your SQL database (see the screenshot below). Alternatively, you should be able to find your database under the “Recent Resources” at <https://portal.azure.com/#home>

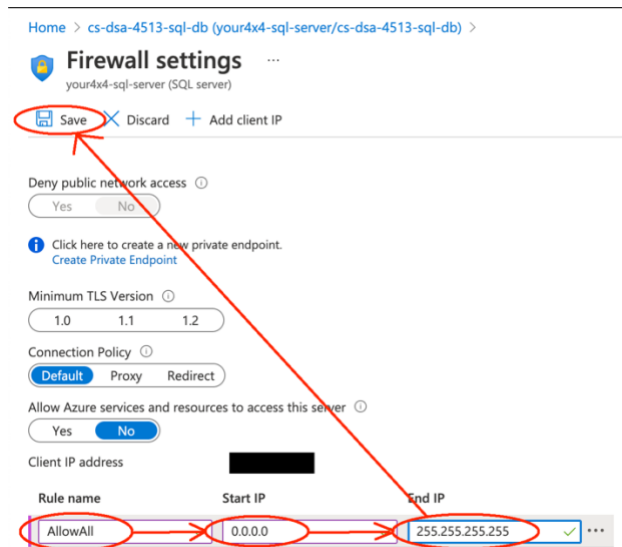

2. This should bring you to your new database overview seen below.
3. Now we need to create Firewall rules to allow outside connection to your DB. Click on “Overview” and then “Set server firewall”

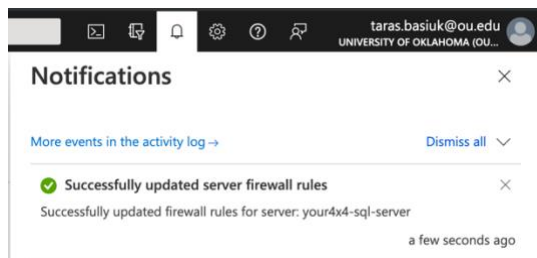

4. You should now see a panel corresponding to the screenshot below (with the input fields being empty).
  - a. Type in “AllowAll” for “Rule Name” field.
  - b. Type in “0.0.0.0” for “Start IP” field.
  - c. Type in “255.255.255.255” for “End IP” field.

- d. Click the “Save” icon.

5. Wait for the updated firewall rules to be deployed.

6. **!!!WARNING!!!** Doing above allows connections to your SQL server from the entire internet. This should be fine for a class project. In general case, however, you would only allow connections from the IP ranges you trust. **!!!WARNING!!!**

### Possible Firewall Configuration Complications

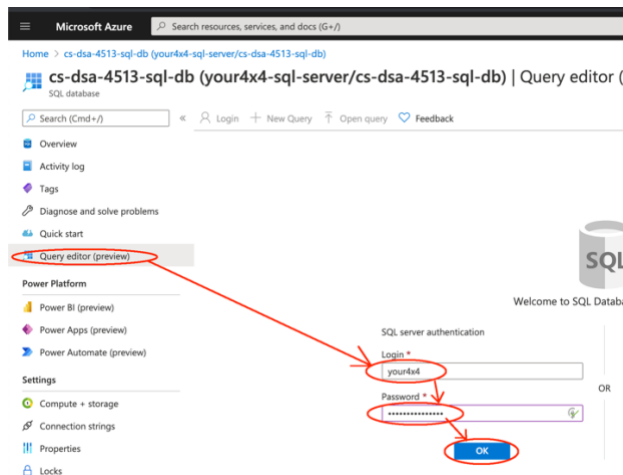

If you’ve made a mistake while creating a new firewall rule, select it from the list, it will become editable, make appropriate changes, don’t forget to click on the “Save” icon (see below).

RULE NAME	START IP	END IP	
			...
AllowAll	0.0.0.0	255.255.255.255	...

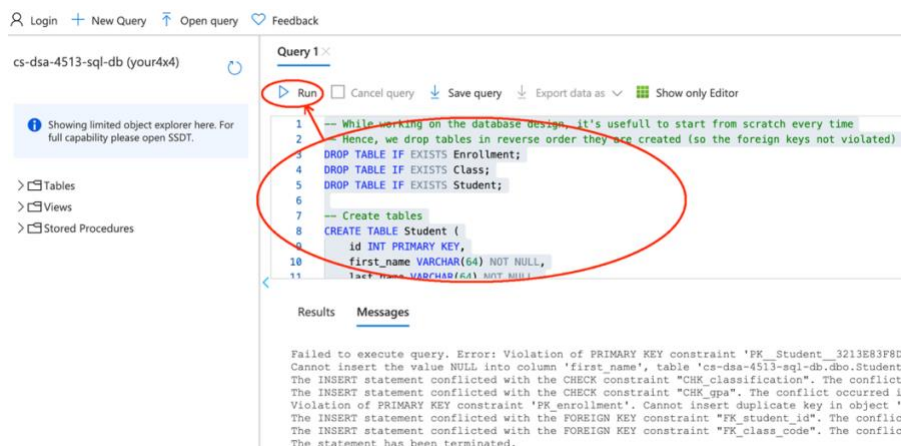

## Connecting to the Database from Azure Portal

1. Navigate back to the database overview (from the search bar or azure portal home).
2. Click on “Query editor (preview)”
3. Use your SQL server admin login and password and click on “OK”

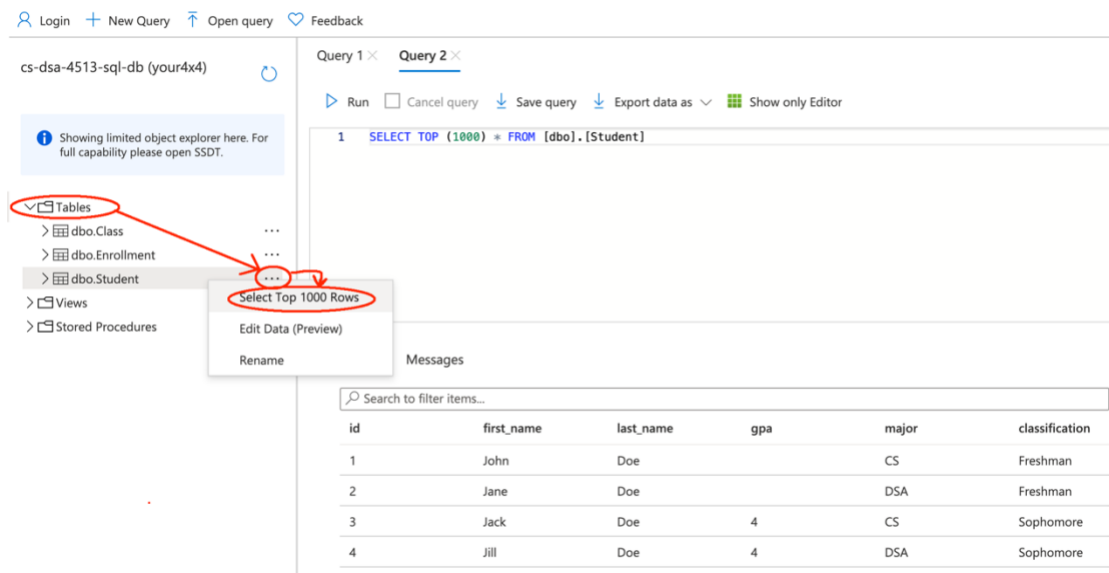

4. Run sample queries (see Appendix A) to make sure the database works (see the screenshot below, ignore the error messages, SQL in Appendix A is deliberately provoking those).
5. **!!!WARNING!!!** You will get logged out from the query editor automatically after some time passes (~30 minutes) and your queries will get discarded. Make sure to work on your queries in some outside environment (see the section below, for example) which persists them and only copy-paste them into the online editor immediately prior to execution.

**!!!WARNING!!!**

6. Whenever you have a table created with some data in it, you can select it in Tables folder and browse the data in it by using the “Select Top 1000 Rows” tab (you will be asked to acknowledge that you’re using a “preview” feature).

## Connecting to Your SQL Database from Azure Data Studio IDE

You will need a development environment for working on your SQL queries with a bit more support than what Azure Portal Query Editor provides, we recommend you download & install Azure Data Studio.

### Steps to Follow

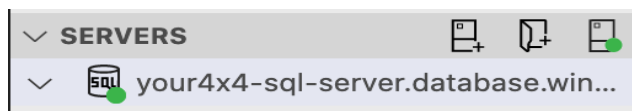

1. Download & Install Azure Data Studio according to the instructions here - <https://docs.microsoft.com/en-us/sql/azure-data-studio/download>
2. Launch Azure Data Studio, close “Welcome” tab.
3. Click on “Servers” icon to the top left, click on “Add Connection” button

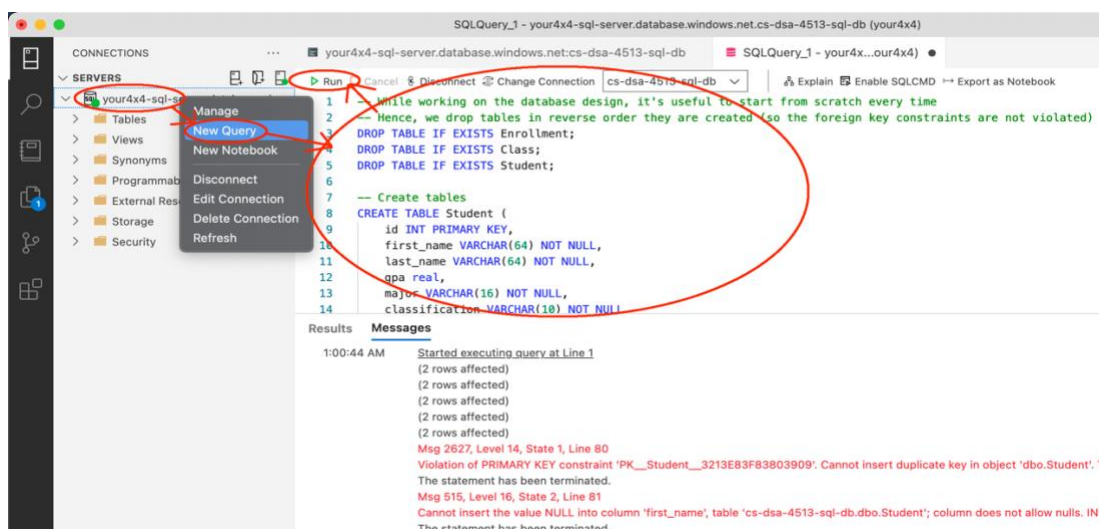

4. You should now see the “Connection” panel to the right, which has some mostly empty input fields at the bottom.
5. Fill out the input fields and make the selections as described below (see the screenshot)
  - a. Server => “<your4x4>-sql-server.database.windows.net”
  - b. Username => “<your4x4>”
  - c. Password => “<password you’ve chosen>”

- d. Database => Pick “cs-dsa-4513-sql-db” (option takes few seconds to appear, given other fields are typed-in correctly) .

6. Click on “Connect” button. Once connected, your SQL server should be added to the servers list (see below).

7. You can now “right click” on your server and select “New Query”. This will open a query editor for you to work with (see screenshot below).
8. You now should have everything you need to complete the Graded Homework #2.

## Appendix A. Sample SQL Queries

\*Below code is also available in a separate file on Canvas to help with the copy-paste issues

```
-- While working on the database design, it's useful to start from scratch every time
-- Hence, we drop tables in reverse order they are created (so the foreign key constraints are not violated)
DROP TABLE IF EXISTS Enrollment;
DROP TABLE IF EXISTS Class;
DROP TABLE IF EXISTS Student;

-- Create tables
CREATE TABLE Student (
  id INT PRIMARY KEY,
  first_name VARCHAR(64) NOT NULL,
  last_name VARCHAR(64) NOT NULL,
  gpa real,
  major VARCHAR(16) NOT NULL,
  classification VARCHAR(10) NOT NULL,

  -- Some examples of attribute value constraints
  CONSTRAINT CHK_gpa CHECK (gpa BETWEEN 0.0 AND 4.0),
  CONSTRAINT CHK_classification CHECK (classification IN ('Freshman', 'Sophomore', 'Junior', 'Senior'))
);

CREATE TABLE Class (
  code VARCHAR(10) PRIMARY KEY,
  name VARCHAR(64),
  description VARCHAR(1024)
);

CREATE TABLE Enrollment (
  student_id INT,
  class_code VARCHAR(10),
  semester VARCHAR(6) NOT NULL,
  year INT NOT NULL,
  grade CHAR(1),
```

```
-- Multi-attribute primary key
CONSTRAINT PK_enrollment PRIMARY KEY (student_id, class_code, semester, year),

-- Some foreign key constraint examples
CONSTRAINT FK_student_id FOREIGN KEY (student_id) REFERENCES Student,
CONSTRAINT FK_class_code FOREIGN KEY (class_code) REFERENCES Class,

CONSTRAINT CHK_semester CHECK (semester IN ('Spring', 'Fall')),
CONSTRAINT CHK_grade CHECK (grade IN ('A', 'B', 'C', 'D', 'F'))
);

-- Insert some valid records

-- Students without GPA
INSERT INTO Student
(id, first_name, last_name, major, classification)
VALUES
(1, 'John', 'Doe', 'CS', 'Freshman'),
(2, 'Jane', 'Doe', 'DSA', 'Freshman');

-- Students with GPA
INSERT INTO Student
